Prodim Door Solution

The installation of doors has always been a time consuming business, which could only be done by skilled people with years of experience. The weight of the doors, and the environment in which they are adjusted, ensured that there was a high risk regarding the "safety" of the doors. That along with an unfavorable work environment, often caused delays to the construction project.

Thanks to the Prodim Door Solution this situation belongs to the past!

**Proliner, world's leading digitizer in
2D & 3D measurements!**

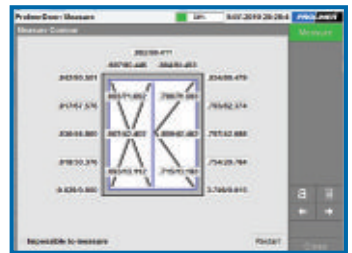

PROLINER®

Measurement made portable

2D & 3D Digital measurement made fast, accurate & easy

Prodim Door Solution: The Solution

The Proliner® measuring device digitally templates and saves the doors on site. These measurements are converted in the office with a CAM module into the program for the CNC machine. With the right shop forms and barcode stickers, the logistic process is monitored much better. The doors are fully machined, including locks, hinges etc.. All doors are completely finished when they leave the shop, as late as possible to be installed on the construction site, so they can be installed and left with a minimum of risk.

Raising Quality

Instead of working on the construction site, activities now find place in the factory, the doors can be machined in optimal conditions with the right tools and the best circumstances for the employees. The production process can now be controlled better, with less risk regarding your employees or tools.

Thanks to automate the process, it is possible to deliver much better quality. Overall, it is possible to recognize measurement errors or checking the requirements so you can react immediately, even before production has started, which of course saves money. The doors are installed at the end of the process, so no more risk of damage by workers from other companies or others people who can damage the doors when they are already installed.
